

***[PID-4]* Resource Lifecycle Management**

Ensuring that resources (e.g., compute, storage) are efficiently allocated, scaled, and decommissioned when no longer needed. [...]

***[PID-10]* Data Management and Storage**

Reducing data growth through efficient retention policies and archiving. Energy-efficient storage solutions and cold storage for less frequently accessed data. Reducing unnecessary data copies and replication.

Data Management and Storage

Reducing data growth by retention/decommission policies; efficient allocation; energy-efficient storage

next to data growth also include data transmission, data retrieval

data growth is not a problem if the data is really used in the business [...] so data usage should be in the definition

to add: improve data quality such as reduce redundancy and duplication for minimizing amount of data to be stored

***[added]* Data Transmission and Retrieval**

Ensuring reliable and low-latency data transmission while optimizing retrieval speed, accuracy, energy-efficiency

***[changed]* Data Management and Storage**

Controlling data growth through retention and decommissioning policies, efficient allocation reducing redundancies, and energy-efficient storage while accepting growth when data is actively used for business needs.
